Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

CUSTOMER JOURNEY MAP

Project: Auto Ticket Classification using Flow Designer

Persona: Priya – Corporate Employee (End User) | Scenario: Submitting and tracking an IT support ticket | Goal: Get my issue resolved quickly with minimal effort

Secondary Actor: Rahul – IT Support Agent | Goal: Quickly understand and correctly route tickets so he can focus on resolution

Journey Stage →	1. Problem Occurs	2. Submit Ticket	3. Waiting / Triage	4. Resolution	5. Closed & Feedback
Stage Goal	Realize something is broken and decide to seek help	Successfully log the issue with enough detail	Know that the right team has my ticket and work has started	Have the issue fixed and be able to continue work	Confirm resolution and optionally give feedback
User Actions	• Notices system/error • Tries basic troubleshooting • Decides to raise ticket	• Opens Service Portal / Email • Fills short description + details • Submits ticket • Receives ticket number	• Checks status occasionally • May call/chat if urgent • Waits for assignment	• Responds to agent questions • Tests the fix • Confirms working	• Marks ticket closed • Rates experience • Returns to normal work
Touchpoints	• Application error messages • Colleague advice • Knowledge base (if any)	• Service Portal form • Email to support • Chatbot (if available)	• Ticket status page • Email notifications • Agent Workspace (for agents)	• Agent emails / calls • Remote session tools • Ticket comments	• Closure email • CSAT survey • Portal history
Thoughts & Quotes	"Why is this happening now?" "I hope this is not a big issue."	"I hope I filled this correctly." "Will anyone actually look at this?"	"It has been 2 hours and still 'New'. "Why is it assigned to the wrong team again?"	"Finally someone is working on it." "Please don't bounce it again."	"That was faster than last time." "I'll rate it 5 if it stays fixed."
Emotions	😞 Confused / Mildly frustrated	😞 Hopeful but uncertain	😞 Anxious / Frustrated (long wait or wrong team)	😊 Relieved / Cautiously optimistic	😊 Satisfied (or 😞 if slow/wrong)
Pain Points (Current State)	No clear self-help path; uncertainty if issue is already known	Form is long; user unsure what category to choose (if asked)	Long time in 'New' state Wrong assignment group Multiple re-assignments No visibility why it is delayed	Agent asks same questions already in description Ticket bounced between teams	No clear confirmation Survey feels pointless if experience was bad
Opportunities (with Auto Classification)	Show suggested knowledge articles based on keywords before ticket creation	Smart form that suggests category (optional) but does not force user to choose Auto-capture browser/OS info	Instant auto-classification & routing via Flow Designer User sees 'Assigned to Network Team' within seconds Confidence + explanation logged	Agent receives correctly classified ticket with context Less back-and-forth Faster first response	Higher CSAT due to speed Feedback used to improve classification model
Backend / System (Flow Designer)	Monitoring / error logs (optional future integration)	Ticket record created → Flow Designer trigger fires	Hybrid classification (Rules + AI) Update Category, Priority, Assignment Group Write audit log + work note If low confidence → Manual Review queue	Agent works in Agent Workspace Can override + give feedback (Correct/Incorrect)	CSAT captured Feedback stored for model improvement Analytics updated

KEY INSIGHT: The biggest emotional drop and operational waste happens in Stage 3 (Waiting / Triage). Manual classification causes long 'New' status, wrong assignments, and rework. Auto Ticket Classification using Flow Designer directly targets this stage — turning a major pain into a near-instant, transparent, and auditable step.
