Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Project Design Phase-II

Data Flow Diagrams & User Stories

Data Flow Diagrams:

A Data Flow Diagram (DFD) is a traditional visual representation of the information flows within a system. It shows how data enters and leaves the system, what changes the information, and where data is stored.

Context-Level (Level-0) DFD – Auto Ticket Classification System

External Entities:

- End User / Employee (submits ticket via Portal or Email)
- IT Support Agent (reviews, overrides, provides feedback)
- Service Desk Manager / Admin (configures rules & monitors)
- External AI Service (optional – LLM / custom model)

Main Process: Auto Ticket Classification Engine (Flow Designer)

Data Stores:

- Ticket / Incident Table
- Classification Audit Log
- Keyword / Decision Tables
- Feedback / Training Data Store
- CMDB / User Directory (read-only enrichment)

Level-1 Data Flow (Core Classification Path):

1. End User → submits Ticket data → Ticket Table
2. Ticket Table → Record Created event → Flow Designer Process
3. Flow Designer → reads Ticket text + metadata → Classification Sub-process
4. Classification Sub-process → Rule Engine (Decision Tables) → high-confidence result OR
5. Classification Sub-process → AI Model (Predictive Intelligence / External API) → prediction + confidence
6. Flow Designer → writes Category, Priority, Assignment Group, Confidence, Explanation → Ticket Table
7. Flow Designer → writes full decision record → Classification Audit Log
8. If confidence low → Flow Designer → creates task / assignment → Manual Review Queue (Agent)
9. Agent → provides Correct/Incorrect feedback → Feedback Store
10. Admin → maintains rules & threshold → Decision Tables
11. (Optional) Flow Designer → calls External AI → returns classification

User Stories

Use the below template to list all the user stories for the product.

User Type	Functional Requirement (Epic)	User Story Number	User Story / Task	Acceptance Criteria	Priority	Release
End User	Ticket Submission	USN-1	As an employee, I can submit a support ticket via the portal so that my issue is recorded.	Ticket is created with Short Description and Description; confirmation is shown.	High	Sprint-1
System / Flow	Auto Classification	USN-2	As the system, when a new ticket is created I automatically classify Category, Subcategory, Priority and Assignment Group.	Within 5 seconds the ticket fields are updated and a work note with explanation is added.	High	Sprint-1
System / Flow	Confidence Handling	USN-3	As the system, if classification confidence is below the configured threshold I route the ticket to the Manual Review queue.	Ticket is assigned to Manual Review group; agent is notified; original data is preserved.	High	Sprint-1
IT Support Agent	View Classification	USN-4	As an agent, I can see the predicted Category, Priority, Assignment Group and confidence score on the ticket form.	Classification fields and confidence are visible in Agent Workspace without extra clicks.	High	Sprint-1
IT Support Agent	Override Classification	USN-5	As an agent, I can override the auto-classified Category / Assignment Group when it is incorrect.	Override is logged; ticket is reassigned; original prediction remains in audit log.	High	Sprint-1
IT Support Agent	Provide Feedback	USN-6	As an agent, I can mark a classification as Correct or Incorrect to help improve the model.	Feedback is stored linked to the original prediction and is available for retraining.	Medium	Sprint-2
Service Desk Manager	Configure Rules	USN-7	As a manager, I can maintain keyword / decision tables used by the rule-based classifier.	Changes to decision tables take effect for new tickets without code deployment.	High	Sprint-1
Service Desk Manager	Set Threshold	USN-8	As a manager, I can configure the confidence threshold that determines auto-assign vs manual review.	Threshold is stored as a system property / config; new tickets respect the new value.	Medium	Sprint-1
Service Desk Manager	Monitor Accuracy	USN-9	As a manager, I can view a dashboard showing classification volume, average confidence, override rate and accuracy trends.	Dashboard updates at least daily; key KPIs are visible on a single page.	Medium	Sprint-2
Admin	Enable / Disable Auto-Assign	USN-10	As an admin, I can turn automatic assignment on or off without disabling the whole classification flow.	When off, classification still runs but assignment is left to agents; audit log continues.	Medium	Sprint-1
System	Audit Logging	USN-11	As the system, I record every classification decision including inputs, outputs, confidence, model version and timestamp.	Audit records are queryable and retained according to data retention policy.	High	Sprint-1
System	External AI Call (Optional)	USN-12	As the system, when platform AI confidence is low I can optionally call an external classification API and use its result.	External call is logged; fallback to manual review occurs on timeout or error.	Low	Sprint-3
IT Support Agent	Explainability	USN-13	As an agent, I can see a short human-readable explanation of why a particular category was chosen.	Explanation appears in work notes or a dedicated field and is understandable without ML knowledge.	Medium	Sprint-2
End User	Faster Resolution	USN-14	As an employee, I expect my ticket to be assigned to the correct team quickly so that resolution starts sooner.	Average time-to-assign is reduced by ≥ 70% compared to pure manual triage baseline.	High	Sprint-1
Service Desk Manager	Reporting for Audit	USN-15	As a manager, I can export classification audit data for compliance or process improvement reviews.	Export includes ticket number, predicted vs final values, confidence, feedback and timestamps.	Low	Sprint-3
