Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	4 Marks

Project Design Phase-II

Solution Requirements (Functional & Non-functional)

Functional Requirements:

Following are the functional requirements of the proposed solution.

FR No.	Functional Requirement (Epic)	Sub Requirement (Story / Sub-Task)
FR-1	Ticket Ingestion & Trigger	• Trigger Flow on Ticket/Incident record creation • Capture Short Description, Description, Caller, CI, Urgency, Impact • Support both Incident and Catalog Request tickets
FR-2	Automated Classification	• Classify Category and Subcategory from free text • Determine Priority (or recalculate based on content) • Recommend / set Assignment Group • Return Confidence Score for each prediction
FR-3	Hybrid Decision Engine	• Apply rule-based / keyword matching first for high-confidence cases • Fall back to AI / ML model for remaining tickets • Configurable confidence threshold (default 0.75)
FR-4	Ticket Update & Routing	• Automatically update Category, Subcategory, Priority, Assignment Group • Re-assign ticket to the recommended group • Set work notes with classification explanation
FR-5	Manual Review Fallback	• If confidence < threshold → route to dedicated Manual Review queue • Notify assigned agent / group • Preserve original ticket data
FR-6	Agent Feedback Loop	• Provide "Correct / Incorrect" feedback UI on classified tickets • Store feedback against original prediction • Use feedback data for model retraining / rule improvement
FR-7	Audit & Explainability	• Log every classification decision (inputs, outputs, confidence, model version) • Store short explanation of why a category was chosen • Make logs queryable for audit and analytics
FR-8	Configuration & Admin	• Admin can maintain keyword / decision tables • Admin can adjust confidence threshold • Admin can enable/disable auto-assignment • Support for multiple ticket types / catalogs
FR-9	Reporting & Monitoring	• Dashboard: classification accuracy, volume, average confidence, override rate • Alerts on sudden drop in confidence or high manual review volume
FR-10	Integration Points	• Optional call to external AI endpoint (Azure OpenAI, custom model) • Optional enrichment from CMDB / User profile for priority boost

Non-functional Requirements:

Following are the non-functional requirements of the proposed solution.

NFR No.	Non-Functional Requirement	Description
NFR-1	Usability	Classification results and confidence must be clearly visible in Agent Workspace. Override and feedback actions should require ≤ 2 clicks. Explanation text must be human-readable.
NFR-2	Security	All classification actions run under controlled service account with least privilege. Full audit trail of who/what changed Category/Assignment. Data encrypted in transit (TLS) and at rest. No PII sent to external AI without redaction or approved DPA.
NFR-3	Reliability	Flow must be resilient: retries on transient failures, fallback to Manual Review on any classification error. No ticket should be left unassigned due to flow failure. Target success rate of auto-classification path ≥ 99.5%.
NFR-4	Performance	End-to-end classification + update must complete within 5 seconds for 95% of tickets. Support peak load of at least 500 tickets/hour without degradation. Caching of frequent patterns recommended.

NFR-5	Availability	Solution availability follows platform SLA (typically 99.9%). Manual Review queue acts as safety net so business process continues even if AI path is temporarily unavailable.
NFR-6	Scalability	Architecture must scale horizontally with platform capacity. Design must support growth from hundreds to tens of thousands of tickets per day without redesign of core flow. Model training can be offline/batch.
