# Final Project Report

## 1. Project Title

Auto Ticket Classification using Flow Designer

## 2. Abstract / Executive Summary

This project delivers an automated ticket classification and routing solution using Flow Designer. A hybrid approach (rule-based Decision Tables + AI classification) classifies incoming support tickets within seconds, updates Category, Priority and Assignment Group, and falls back to a Manual Review queue when confidence is low. The solution reduces manual triage effort, improves consistency and SLA performance, and provides full auditability and an agent feedback loop for continuous improvement.

## 3. Problem Statement

Manual classification of support tickets is slow, inconsistent across agents, and causes delayed assignment, rework and SLA risk. Scaling the Service Desk currently requires more people rather than removing the triage bottleneck.

## 4. Proposed Solution

An event-driven Flow Designer process that triggers on ticket creation, applies hybrid classification, updates the ticket, routes low-confidence cases to Manual Review, logs every decision, and accepts agent feedback for improvement.

## 5. Key Deliverables Completed

- Ideation Phase artefacts (Empathy Map, Problem Statements, Brainstorming)
- Design Phase artefacts (Technology Stack, Solution Requirements, DFD & User Stories, Customer Journey Map)
- Solution Architecture, Proposed Solution, Problem-Solution Fit
- Project Planning (Backlog, Sprints, Velocity, Planning Logic)
- UAT Report and Performance Testing documents
- FSD and Project Documentation

## 6. Results & Outcomes

- Classification path meets < 5 second target for 95% of tickets
- Hybrid design balances accuracy, explainability and speed
- UAT passed – recommended for pilot
- Performance testing passed under expected and peak load
- Clear Problem-Solution Fit established with agents and managers

## 7. Conclusion

The Auto Ticket Classification solution using Flow Designer successfully addresses the manual triage bottleneck. It is architecturally sound, functionally complete for pilot, performance-validated, and accepted by representative users. The project is ready for controlled production pilot and subsequent organisation-wide rollout.

## 8. Future Work

Continuous learning from feedback, multi-language support, attachment classification, and automated backlog re-classification.
