Problem – Solution Fit Template (Sample – Filled)

This document demonstrates a completed Problem-Solution Fit for the project Auto Ticket Classification using Flow Designer.

1. Who is the customer?

IT Support Agents who classify and assign tickets daily. Also felt by End Users (waiting time) and Managers (SLA & consistency).

2. What is the real problem?

Manual triage is slow, inconsistent and does not scale. Tickets remain unassigned longer than necessary, causing SLA risk and agent burnout.

3. How do they currently solve it?

Agents manually read and classify every ticket using personal experience. There is no shared, consistent, auditable process.

4. What is our solution?

Flow Designer hybrid engine: Decision Tables for high-confidence cases + AI model for the rest, with confidence threshold, Manual Review queue, full audit and agent feedback loop.

5. Why does the solution fit the problem and behaviour?

- It removes the most painful step (manual reading & deciding) for the majority of tickets.
- It keeps the agent in control for uncertain cases (matches existing trust model).
- It runs inside tools agents already use (Agent Workspace).
- It produces an explanation and accepts feedback – matching how agents learn and managers measure quality.

6. Evidence

- Empathy Map & Journey Map identified triage as the critical pain stage.
- UAT passed with real agents.
- Performance targets met (< 5 s for 95% of tickets).
- Clear Problem-Solution Fit statement accepted by stakeholders.

7. Conclusion

Problem-Solution Fit is confirmed. The solution addresses a real, frequent and costly problem in a way that fits existing agent behaviour, tools and success metrics.
