Project Name	Auto Ticket Classification using Flow Designer
Maximum Marks	2 Marks

Problem – Solution Fit Template

The Problem-Solution Fit simply means that you have found a problem with your customer and that the solution you have realized for it actually solves the customer's problem. It helps identify behavioral patterns and recognize what would work and why.

Purpose:

- Solve complex problems in a way that fits the state of your customers.
- Succeed faster and increase your solution adoption by tapping into existing mediums and channels of behaviour.
- Sharpen your communication and marketing strategy with the right triggers and messaging.
- Increase touch-points by finding the right problem-behaviour fit and building trust by solving frequent, urgent or costly problems.
- Understand the existing situation in order to improve it for your target group.

1. Customer Segment

Primary: IT Support Agents / Service Desk Analysts who currently spend significant time manually reading and classifying tickets.

Secondary: End Users (employees) who submit tickets and suffer from slow or incorrect assignment.

Tertiary: Service Desk Managers who need consistent, auditable triage and better SLA performance.

2. Customer Problems / Jobs-to-be-Done

- Agents must read every ticket description to decide Category, Priority and Assignment Group – highly repetitive and error-prone.
- Inconsistent classification across agents leads to wrong routing, rework and SLA risk.
- Tickets sit in 'New' status for long periods, causing user frustration and delayed resolution.
- Managers lack reliable data on why tickets were classified a certain way (no audit trail).
- Scaling the Service Desk currently means hiring more agents rather than removing the bottleneck.

3. Current Behaviour / Workarounds

- Agents use personal mental rules or copy-paste from similar past tickets.
- When unsure they choose 'General' or the most common group – creating hidden queues.
- Users follow up via chat/phone when ticket remains unassigned.
- Managers manually sample tickets for quality checks.

4. Proposed Solution (fits the problem)

An automated hybrid classification engine running inside Flow Designer that:

- Triggers instantly on ticket creation
- Uses rules for high-confidence cases + AI for the rest

- Writes Category, Priority, Assignment Group + confidence + short explanation
- Routes low-confidence tickets to a controlled Manual Review queue
- Captures agent feedback so the system improves over time
- Leaves a complete audit trail for every decision

5. Why this solution fits the customer state

- Agents already work inside the same platform (Agent Workspace) – no new tool to learn.
- Flow Designer is already available; no heavy custom development required.
- Hybrid approach respects current rule knowledge while adding AI power.
- Human remains in the loop (override + feedback) – builds trust instead of replacing agents.
- Solves the most frequent, urgent and costly daily annoyance (triage) rather than a rare edge case.

6. Evidence of Fit (to be validated in pilot)

- Time-to-Assign reduction measurable in platform reports.
- Override rate and feedback scores show whether agents trust the predictions.
- User CSAT / follow-up volume indicates whether end-users feel faster service.
- Classification accuracy vs human baseline on a held-out ticket sample.

7. Summary – Problem-Solution Fit Statement

IT Support Agents and End Users experience daily pain from slow, inconsistent manual ticket triage. The proposed Auto Ticket Classification solution, running natively in Flow Designer with a hybrid rules+AI approach, confidence thresholds, full audit logging and agent feedback, directly removes that pain while fitting the existing tools, skills and governance of the Service Desk. Therefore a clear Problem-Solution Fit exists and is ready for pilot validation.
