Project Name	Auto Ticket Classification using Flow Designer
Document	Brainstorming – Idea Generation – Prioritization

BRAINSTORMING – IDEA GENERATION – PRIORITIZATION

Project: Auto Ticket Classification using Flow Designer

1. BRAINSTORMING RULES (Reminder)

- Defer judgment – no idea is bad at this stage
- Go for quantity – aim for many ideas
- Build on the ideas of others
- Stay focused on the problem (ticket classification & routing)
- Be visual and concrete where possible

2. IDEA GENERATION – Raw Ideas for Auto Ticket Classification

Focus Question: How can we automatically classify and route support tickets using Flow Designer?

Idea 1: Keyword + Regex based classification inside Flow Designer (no ML needed)

Idea 2: Use ServiceNow Predictive Intelligence / Classification framework triggered from Flow

Idea 3: Call an external AI model (Azure OpenAI / Google Vertex / custom ML) via Integration Hub or REST from Flow Designer

Idea 4: Train a custom Classification model on historical tickets and invoke it via Flow action

Idea 5: Hybrid approach: Rule-based first (high confidence keywords) → AI for remaining tickets

Idea 6: Use Document Intelligence / AI Search to classify based on short description + description + any attachments

Idea 7: Multi-label classification (a ticket can belong to more than one category) with confidence scores

Idea 8: Real-time classification on ticket insert (Business Rule or Flow triggered on create)

Idea 9: Batch re-classification of existing open tickets every night

Idea 10: Agent feedback loop: “Was this classification correct?” button that improves the model

Idea 11: Explainable AI – show the top 3 reasons why a ticket was classified a certain way

Idea 12: Priority auto-calculation using urgency keywords + impact from CI / user location

Idea 13: Assignment Group recommendation based on past similar tickets + current team workload

Idea 14: Fallback to “Needs Manual Review” queue when confidence < threshold

Idea 15: Pre-built Flow templates that other teams can clone and adapt for their catalog items

3. IDEA CLUSTERING / THEMES

A. Rule-Based / Low-Code Native: Idea 1, Idea 5 (first part), Idea 8

B. Platform AI / Predictive Intelligence: Idea 2, Idea 4, Idea 12, Idea 13

C. External / Generative AI: Idea 3, Idea 6, Idea 7, Idea 11

D. Continuous Learning & Governance: Idea 10, Idea 14, Idea 9, Idea 15

4. PRIORITIZATION MATRIX (Impact vs Effort)

Using a simple 2x2 matrix (High/Low Impact × High/Low Effort)

Priority Bucket	Ideas	Rationale
Quick Wins (High Impact / Low Effort)	Idea 1 (Keyword rules) Idea 5 (Hybrid start) Idea 8 (Trigger on create) Idea 14 (Confidence threshold)	Can be built quickly inside Flow Designer with existing skills. Immediate value.
Big Bets (High Impact / High Effort)	Idea 2 / 4 (Predictive Intelligence) Idea 3 (External AI) Idea 10 (Feedback loop) Idea 11 (Explainability)	Highest long-term accuracy and trust, but needs model training / integration work.
Fill-ins (Low Impact / Low Effort)	Idea 9 (Nightly batch) Idea 15 (Reusable templates)	Nice to have, low risk, can be done later.
Money Pits (Low Impact / High Effort)	Full multi-label + attachment OCR from day 1	Avoid starting here – complexity without proven need.

5. SELECTED IDEAS TO TAKE INTO PROTOTYPING / DESIGN

1. Start with a Hybrid Flow in Flow Designer: Rule-based classification for high-confidence keywords + AI fallback.
2. Trigger the flow on ticket creation (Record Created trigger).
3. Output: Category, Subcategory, Priority, Assignment Group, Confidence Score, and Explanation.
4. If confidence < 0.75 → route to “Manual Review” assignment group and notify an agent.
5. Capture agent feedback (“Correct / Incorrect”) to improve rules/model over time.
6. Log every classification decision for audit and continuous improvement.

6. NEXT STEPS

- Validate the selected ideas with 2–3 Service Desk agents (quick feedback session).
- Create a simple Flow Designer prototype for the hybrid approach.
- Define success metrics and a small pilot scope (e.g., one catalog item or one assignment group).
- Prepare data set of historical tickets for testing accuracy.
