Project: Auto Ticket Classification using Flow Designer

WHO are we empathizing with? IT Support Agents / Service Desk Analysts & End Users (Employees) who submit tickets

What do they need to do? Quickly and accurately classify, prioritize, and route incoming support tickets so the right team resolves them fast, reducing backlog and improving user satisfaction.

SEE • Long queues of unassigned tickets in the portal • Colleagues manually tagging categories every morning • Dashboard showing rising average handle time • Users submitting vague tickets like “system not working” • Competitors using AI-powered classification	THINK & FEEL • “There are too many tickets and I spend half my day just categorizing them.” • “I’m worried about misclassifying a critical P1 and causing SLA breach.” • “I wish the system could understand the ticket intent automatically.” • Feels overwhelmed, anxious about accuracy, frustrated by repetitive work.	HEAR • “Why is my ticket still in ‘New’ after 4 hours?” (from users) • “We need better auto-routing before the next audit.” (Manager) • “Flow Designer + AI can classify tickets in seconds.” (Architect) • “Manual classification is a bottleneck.” (Team lead)
USER IT Support Agent + End User	SAY & DO SAY: • “I’ll just put it under ‘General’ for now.” • “Can someone re-categorize this? It’s actually a network issue.” DO: • Manually read every ticket description • Copy-paste keywords into search to find similar past tickets • Escalate when unsure of category/priority	CONTEXT High-volume Service Desk using Flow Designer
PAIN	KEY INSIGHT	GAIN

• High volume of tickets → burnout • Inconsistent classification across agents • SLA breaches due to wrong routing • Time wasted on repetitive categorization • Lack of confidence in AI suggestions (if any) • Users get frustrated by slow response	Both agents and users suffer from slow, inconsistent manual ticket triage. Automating classification inside Flow Designer removes the bottleneck and creates trust through transparent, auditable decisions.	• Tickets auto-classified with high accuracy • Right team gets the ticket instantly • Reduced average time-to-assign • Agents focus on resolution, not triage • Higher CSAT / lower ticket backlog • Auditable, consistent classification rules
